A BARRY-WEHMILLER COMPANY

## Robotic Rotary Case Palletizer

### Key Features

- Extremely versatile configurations for infeed and discharge resulting in very efficient usage of available space
- Extremely accurate package placement
- Very low maintenance
- PLC-controlled with touch-screen interface for easy operator control
- Multiple product types possible at the same time
- Pattern controls allow for greater flexibility in pattern selection including options such as “label out”
- Virtually unlimited in terms of available patterns
- Available bar code scanning for product determination
- Available servo-controlled turntable for single lane of infeed/discharge

# Robotic Rotary Case Palletizer

The Robotic Rotary Case Palletizer is a workhorse, handling up to eight different SKUs of product at the same time. The system is designed for companies currently palletizing multi-product, rainbow packaging, or with multiple lines feeding a common palletizer. Our Robotic palletizing solution is capable of handling an array of case sizes and layer patterns simultaneously. When utilizing a bar code reader, our system can detect misprinted cases, misclassified product or corrupt product by rejecting one or batches of product automatically. Our robotic case palletizing systems can operate in the harshest of environments including sub-zero freezer applications.

FleetwoodGoldcoWyard offers decades of experience in material handling, coupled with proven robotics technologies and capabilities. Our new product offerings feature compact designs to save valuable floor space, handle multiple products in a single cell, utilize electro-servo-driven technology with no hydraulics, require less maintenance, and are designed to outlast conventional palletizing and depalletizing equipment.

Contact the experienced sales team of FleetwoodGoldcoWyard today to review your application(s) and to see how the Robotic Rotary Case Palletizer can benefit your company.
